

TEXTILE ROOFS 2016 BERLIN

Textile Roofs 2016, the twenty-first International Workshop on the Design and Practical Realisation of Architectural Membranes, took place on 2–4 May, 2016 at the Archenhold Observatory Berlin, and was chaired by Prof. Dr.-Ing. Rosemarie Wagner (Karlsruhe Institute of Technology, KIT) and Dr.-Ing. Bernd Stary (Berlin Academy of Architectural Membrane Structures, AcaMem). It was attended by 77 participants from 19 countries covering four continents. Once again, the attendance demonstrated the success of the event, which has become firmly established since it was first held in 1995.

The lightweight design approach

Jürgen Hennicke, IL - University of Stuttgart & Vienna University of Technology.

Jürgen Hennicke addressed the lightweight design approach to design inspired by nature and by history, illustrated by his invaluable 100 slide collection. More than 50 ideas coming from the research conducted at the former IL Institute, Stuttgart were shown: tents, velaria, nets, spider webs, yurts, cantilevers, false arcs, arches, snails, radiolaria, grid shells, pneumatics, bubbles, hot air balloons, the Stonehenge's ring, trees, ramification, suspended chains, tubes, prestressed membranes, humps and funnels, among many others.

In conclusion, lightweight structures were considered as a way to build in accordance with the principles of stability, utility, beauty, and sustainability in order to shelter people, to recycle materials, and to compensate for 60% of the natural resources consumed for building construction.

An impressive example of the application of these principles is the pneumatic gridshell "PlusMinus," made of inflated film tubes flexibly connected, and completed for stability and rigidity by two shell films vacuum sealed above and below the tube latticework (Fig. 1). PlusMinus is a project initiated by students of the University of Stuttgart, Architecture Faculty, Institute for Lightweight Structures and Conceptual Design, in cooperation with the Bionic Learning Network of Festo.

Figure 1. "PlusMinus" inflated gridshell. University of Stuttgart, leichtbaukunst & FESTO.

Figure 2. The sag being equivalent to 30% of the span amplifies the load by 1,30. The sag being equivalent to 5% of the span amplifies the load by 5,10.

Figure 3. With Batyline Aw by Serge Ferrari, in the Vaujany ice skating ring the reverberation time has been reduced from 7,7s to 1,8s.

Pathology

Josep Llorens, School of Architecture, Barcelona.

Josep Llorens' presentation was based on the idea that failures are a source of knowledge that help to prevent future troubles. Failures in tensile structures can be due to:

- material failures, usually due to an inadequate resolution of requirements and properties.
 - the design is responsible for the resultant flatness (Fig. 2), lack of prestress, or an inadequate shape, resistance, or detailing.
 - the installation process involves stability issues, provisional situations, and the final shape.
 - final use does not always correspond to the design specifications. Maintenance is necessary in order to keep the structure clean and to preserve the effects of pre-tensioning.
- The responsibility of failure prevention lies with the owner, designer, manufacturer, builder, supplier, or users. All of the agents should be involved.

Innovative materials for tensile roofs and acoustic

Farid Sahnoune - Serge Ferrari
<http://en.sergeferrari.com/>

Farid Sahnoune began his speech by presenting the highly durable and recyclable new material "Précontraint TX30," the latest generation of flexible composites from Serge Ferrari, developed especially to guarantee a useful life of over 30 years for benchmark project roofing.

In contrast to conventional technologies, the material is "crosslinked," using a reticulated process which to date has been used exclu-

vely to produce rigid materials. Its ability to withstand oxidation over the long term ensures that its structural and aesthetic properties remain unimpaired for decades.

The next point addressed was the Taxyloop technology used to recycle polyester-PVC flexible composite materials that produces secondary raw materials of high intrinsic value, compatible with multiple processes. In recycling, the impact is reduced by 50% in comparison to incineration or landfilling.

In the last part of his presentation Farid Sahnoune referred to Batyline Aw, a varnished PVC-coated cloth for acoustic ceilings and walls. Its calibrated micro-texture ensures its sound absorption performance characteristics, resulting in a fine, lightweight, and compact material that achieves highly uniform acoustic behavior, ranging from treble to bass sounds. The material also achieves significant reduction in reverberation time, adapting to comfort requirements for buildings receiving the public (Fig. 3). It absorbs 65% of sound, transmits 41% of light, and protects from solar heat (-59%) and glare beneath a glass roof or facade.

Computational modelling of lightweight structures

Jürgen Holl, technet GmbH? <http://technet-gmbh.de/index.php?id=74&L=1>

"All models are wrong, some are useful" quoted Jürgen Holl in his introduction to the need for modelling. Models are abstractions or partial views of the reality that represent approximately the object's main features, including the connections among them, but he emphasized that they are not definitive. He mentioned physical and computer models, indicating that the latter allow for analysis that would be impossible to perform by other means, but they need to be sufficiently correct, precise, and complete. The modelling presentation was illustrated with hybrid systems, pneumatic structures, reinforced air halls, multi-chamber cushions, and textile halls.

Computational modelling has been recently refined with the introduction of shear and

Figure 4. The umbrella of 53m in diameter is no longer a lightweight structure (Bodo Rasch).

Figure 5. Wacker Ingenieure wind tunnels.

Figure 6. A prototype of a modular canopy for parking lots developed at the Karlsruhe Institute of Technology.

Development of transparent textile structures for applications in architecture

Rosemarie Wagner,
Karlsruhe Institute of Technology.

Rosemarie Wagner presented a research concerning "ETTLIN black," a fabric for exterior use which is UV-resistant and fade-resistant. The research was conducted at the Karlsruhe Institute of Technology. (<http://www.ettlin-textiles.de/produkte/gewebe/ettlin-black>).

Objectives of the research and development were the applications of double-curved membranes in architecture, the optimization of material choices and functional properties of the product, its mechanical behaviour, and detailing. The investigation was completed with the design of a prototype of a modular canopy for parking lots (Fig. 6).

Tensioned fabric structures design guide ASCE/SEI 2913

Maqsood Ahmed, Specialty Structures, Amherst: <http://www.specialtystructuresusa.com/contact.html>

Maqsood Ahmed began summarizing the guide edited by C. G. Huntington and published by ASCE: "Tensile fabric structures. Design, analysis and construction." He emphasized that certain recommendations and rules are needed to prevent the loss of faith in the fabric industry, and consequent revenues, because low performers face the risk of failures, litigation in courts, and bankruptcy, resulting in the disappointment of building authorities and clients. He proclaimed the following verdict: "Not everyone who can afford a welding machine can become a fabric specialty contractor." The guide covers the history and development of fabric structures, the design process, characteristics of fabrics and foils, loads, form finding, structural analysis, detailing, non-structural performance, manufacture (including patterning), and installation. It is completed by a glossary of terms, a reference to wind tunnel tests, and bibliography.

He dedicated the second part of the lecture to special structures that combine fabric with other materials. "When a customer asks for an apple, you can offer a fruit salad," was his philosophy. His firm "Specialty Structures USA" aims to bridge the gap between architects and engineers, connecting creative designs with specialty contractors across the world, helping

crimp stiffness that steers the different behaviour under load with different material directions. Regarding the definition of the form, Jürgen Holl stressed once again that the form is not free because equilibrium depends on the prestressed state and the boundary conditions. The analytical form finding can be based on the force density method and the non-linear static analysis includes the membrane, cables, struts, and the bending of stiff elements. This inclusion of all elements involved has shown to yield favourable results because the changes in shape caused due to deformations generally result in smaller membrane stresses. The speaker also commented on the cutting pattern generation, its influential factors, compensation, verification, adjustments, cutting drawings, seam allowances, welding marks, visualisation, export to cutting machines and automatic patterning for cones, saddles, and air halls (see previous TR Reports at <http://www.textile-roofs.de>). He finally invited the audience to experience an "easy" modelling hands-on development of practical case studies in an informal tutorial workshop.

Light architecture

Mustafa Rasch, SL Rasch GmbH:
<http://www.sl-rasch.com/>

The special guest lecture was given by Mustafa Rasch. He reviewed the career of his father, who followed the path of his grandfather, and gave special mention to his collaboration with Frei Otto. Among the works presented, umbrellas were examples of the most representative and evolved. They started from the umbrellas of Kassel 1955, Pink Floyd 1977, the

solar powered umbrellas 1987, Madinah 1991 and 2011, Texas 2013, the U53 umbrella 2016, and the future project for the Schlossplatz in Stuttgart. He revealed that the biggest umbrellas don't fit into the stereotypical classification of lightweight structures (Fig. 4).

Wind loads on fabric structures and corresponding dynamic response

Martin Zaszke, Wacker Ingenieure:
<http://www.wacker-ingenieure.de/>

Wacker Ingenieure is a spin-off company of the Karlsruhe Institute of Technology, specialised in wind load analysis of special construction not covered directly by building standards, such as high-rise buildings, stadium roofs, towers, photovoltaic panels, cathedral spires, and fabric roofs.

Wind effects are often decisive and unique for membrane roof design, with wind tunnel testing being the most exact and affordable tool to gather raw data with subsequent dynamic and statistical computations, used to obtain optimized and safe load distributions for the structural engineer (Fig. 5). When performing wind load analyses, the task of Wacker Ingenieure consists of analysing the effects of the wind to consider whether the deformations are significant and that they require feedback (a common situation with flexible structures). The final aim is to provide design-relevant peak values of target variables, e.g., maximum uplift or maximum internal stress.

Martin Zaszke ended his lecture stating that the sooner the wind engineer is involved in the structural planning in an early stage, the greater the optimization potential is.

creative ideas get built, and making innovations affordable. In summary, they turn ideas into reality, blending art with structural design. His bold ideas were profusely illustrated with examples that partially met the expectations generated by the presentation (Fig. 7).

Details in membrane architecture. "My way to enthusiasm."

Horst Dürr, Tensile Evolution
www.tensileevolution.com/html/about.html

With a series of questions, Horst Dürr caught the interest of the audience in detailing textile roofs. His aim was to awake the interest in what has transpired so far and what is expected in the future. He emulated Albert Einstein with his assertion "*the important thing is to not stop questioning*," particularly the six key words: who? what? where? when? how? and why?, which he reminded were the six honest manservants who taught Rudyard Kipling all he knew. He considered the need for viewing things in new ways or from different perspectives in order to be creative, and to generate new possibilities and alternatives.

Detailing is a part of the design process where certain problems are solved. The process starts by clarifying the problems, which evolve by means of ideas, opinions, beliefs, plans, or mental pictures that have to be evaluated and finally realized. The result is a complex whole, whose components are arranged according to

their requirements. As an illustration of his enthusiastic and creative method, Horst Dürr presented the design of a corner, combining membranes, reinforcements, pockets, belts, turnbuckles, seams, Keder, and cables (Fig. 8). The total cost was also estimated starting from the detailed list of quantities of all parts involved, and multiplying them by their unit costs. The speaker finally invited the audience to provide some ideas about their interests and to participate in the Seminar: "Idea-sketch-model-ff-presentation model" this coming October 2016: horst@tensileevolution.at.

New structures

Gregor Grunwald, Pfeifer Systems
<http://www.pfeifer.de>

Pfeifer Systems is specialised in movable, retractable, convertible building systems, offering innovative solutions for the development, design, and construction of special drive technology and transport solutions. Primary functions are the development, design, and construction of these drive and control systems of large-scale shelters, based on in-house FEM calculations. The company expanded with the incorporation of Covertex, in July 2015. Gregor Grunwald showed some remarkable works: the Msheireb retractable roof in the heart of Doha, Qatar (TensiNews 29, p.14), the Rosa Parks Transit Center in Detroit (<http://www.archdaily.com/30880/rosa-parks->

[transit-center-ftl-design-engineering-studio](http://www.transit-center-ftl-design-engineering-studio)) and the ASU Skysong Innovation Center, Scottsdale, Arizona (<http://www.fabritecstructures.com/portfolio-asu-skysong-innovation-center-scottsdale-az>)

Imagine tomorrow. Replacement and renovation of textile structures

Alexander Rüter, CENO Membrane Technology GmbH: www.ceno-tec.de.

The presentation of Dipl.-Ing. Alexander Rüter was truly instructive. His main theme was "*Imagine Tomorrow*." When designing and building textile projects, various construction materials with different life spans are used in one single project. This causes the need for replacement of at least the fabric parts in many projects. Apart from the lifespan of the different materials, other factors that cause the need for replacement include improper design or handling, and even vandalism. Several examples were shown including the Munich Airport Center, a PTFE-coated glass-fibre fabric where 5 of 7 existing panels were replaced while the airport was in full service (Fig. 9).

Conclusions were twofold:

- 1) the life span of PTFE-coated glass-fibre fabric is longer in principle, but glass fibres are very sensitive to handling and transportation.
- 2) "*Think about tomorrow*": consider the requirement of future replacements in the design.

Technical membranes market in Portugal.

Antonio Galhardo, APG Coberturas
www.apgcoberturas.com

APG started its activity in the production of tarpaulins and covers for trucks in 1958 under the hand of its founder, Mr. Abel Pereira Gonçalves. The company grew considerably, becoming the market leader from 1973 onwards. Referrals of their products created the need to expand the range into areas that until then were unexplored. They asserted the ability to implement any project in the area of textile architecture using recyclable materials that have high aesthetic beauty, longevity, efficiency, and low costs.

- PVC/PES Membrane Material
- Doubling
- Border pocket
- Belt with triangle
- Turnbuckle
- Border cables with fitting
- Seam pocket
- Seam doubling
- Seam doubling Keder
- Systempoint cables
- Systempoint belts

Figure 8. Corner detail. Horst Dürr.

Figure 9. Replacement of the PTFE coated glass fibre fabric of the Munich Airport Centre.

Figure 10. ETFE cushions of the "Dolce Vita Tejo" shopping mall in Lisboa replaced by PVC coated polyester fabric.

Their best credentials are the works they've done in textile architecture, tents, covers, façades, ceilings, advertising, and transport. The most surprising work that Antonio Galhardo presented was the replacement of ETFE by PVC-coated polyester for the 10x10m cushions of the "Dolce Vita Tejo" shopping mall in Lisbon (Fig. 10). Could the replacement of ETFE cushions be considered a new market potential for PVC-coated polyester?

Report on current gmp Architekten projects

Martin Glass, gmp Architekten.
<http://www.gmp-architekten.de>

Martin Glass began his talk by pointing out that despite what the title says, he could not show ongoing projects due to a lack of permission. Nevertheless, he showed once again a wealth of past projects, summarizing their main characteristics, available at the website.

The Twenty-second International Workshop on the Design and Practical Realisation of Architectural Membrane Structures will be held on 15-17 May 2017. Its format will be similar to that of TR 2016, with seminar-style lectures and hands-on activities. It will be preceded by the student seminar and sponsored by Serge Ferrari, Pfeifer and technet, and supported by TensiNet, KIT and gmp. <http://www.textile-roofs.de>.

The art and the material

Benoit Legall, BHD Group
<http://www.bhd.fr/>

Benoit Legall presented his company BHD, a leading industrial group in the transformation of technical textiles for the protection of people and goods. BHD is a group of 26 subsidiaries, each of which has specialist expertise in one or more sectors. Given the wide range of skills of its subsidiaries, the BHD group offers unique and dependable specialists in Europe. Its areas of expertise and business sectors are: textile architecture, signage, advertising and construction, industry, transport, aviation, civil, environment, agriculture, sport, outdoor, and event protections. He highlighted two recent works: the Nice and Lyon stadiums (Figs. 11 and 12).

Fascination for textiles and light! Structure and sculpture

Laars Meeb-Olsohn, leichtbaukunst
<http://leichtbaukunst.de/>

Laars Meeb-Olsohn presented an overview of his projects that show striking temporary installations for tradeshows and events, combining light and membranes (Fig. 13). The Riverside Lounge of Light was a light installation for the light art festival LUMINALE 2016, Frankfurt, between 13 and 18 March, 2016. Square and diamond-shaped screens were combined. The LOOPS pavilion, BAU 2011 Munich, introduced innovative products and services around the light and membrane construction.

Figure 11. Nice Stadium. End customer: City of Nice. General contractor: VINCI. Architect: Willemotte, Paris. Material: 20.000m², 1002 Fluotop T2. Fabrication time: 7.000 hours. Installation time: 5 months (8 people).

Figure 12. Lyon Stadium. End customer: Olympique Lyonnais. General contractor: VINCI. Architect: Populous, London. Material: 20.000m² 1202 TX 30. Fabrication time: 15.000 hours. Installation time: 7 months (15 people).

Figures 15 to 18. Installation of the four-point sail at the Archenhold Observatory garden.

Architectural design of lightweight membrane structures

Robert Roithmayr, formfinder
<http://www.formfinder.at>

Robert Roithmayr introduced his "formfinder" software. He started mentioning the artistic and architectural concepts hidden behind sketched ideas or fillings. In fact, "formfinder" starts from a hand-drawn sketch that was examined in terms of its physical, geometrical, and architectural characteristics. The design is compared with projects, materials, and details that have been implemented as a database. As an example of application, Robert Roithmayr showed the Palma Aquarium canopy to guide people into the building (Fig. 14). He considered it as something new that could not have been constructed with concrete.

Joint participant project

Stev Bringmann, 3dtext GmbH.

Starting from the design, the entire manufacturing and installation process of a four-point sail was carried out during the TR 2016 Workshop (Figs. 15 to 18). Phases involved were: "easy" modelling (form finding, structural analysis, and patterning), manufacture, foundations, assembly (masts, edge cables, corner plates, erection, and tensioning), and discussion (general design aspects, form, patterning, and detailing).

The **Student's project week** was led by Prof Dr.-Ing. **Rosemarie Wagner** between May 2nd and May 4th 2016 in parallel to the main event of Textile Roofs Workshop. The topic this year was an outdoor, self-transportable shade/resting place. It is discussed in another article of TensiNews.
